**jCapture**

This should be re-done with the Screen Capture API

**jCapture** is a FOSS Java applet (originally offered as a DokuWiki plugin) and which has been included as a feature of Tiki10 to become our Screencast/ScreenCapture solution.

Everything related to the jCapture applet will progressively move to http://sourceforge.net/projects/jcapture-applet/ but this page serves to coordinate development in improving the Tiki-jCapture interaction.

- you? (add your name)

Urgent

Top priorities

Others

2. Requires Token Access but even if you don't activate, feature/button is available but not working (2012-12-10 10.x)
3. tool by default in toolbar when feature activated done
4. jCapture screencast: Detect for Java and provide a link to download
5. Pref to indicate where files are stored (Which file gallery?) Done
6. Add a "capture screenshot or screencast" link on tiki-list_file_gallery.php, perhaps in elFinder?
7. Make it possible to play Flash files and any format supported by PluginMediaPlayer when listing files at tiki-list_file_gallery.php fixed in trunk with new param
8. Would be nice to be able to draw on the image (so embed draw plugin vs img?) Drawing works on img plugin. Yay!
9. Make it work in WYSIWYG mode or remove the tool from WYSIWYG mode fixed

Only if easy

- Seems to conflict with basic auth here: [http://nextdev.tiki.org/Report+a+Bug](http://nextdev.tiki.org/Report+a+Bug) (Error saving image HTTP/1.1 Authorization Required)
  - 2012-12-13: still a problem, but it's an edge case. Java now does ask for basic auth password
Testing jcapture recording on dev.t.o

Since there were some issues with the automatic upload of some screencasts with jcapture on dev.t.o, some more testing has been done. It seems to work.

PHP mode in dev.t.o changed to FPM:

Next steps

1. Find a way to send to Kaltura (if configured in Tiki)
   - Once Flash is no longer the only format

Export to a format Kaltura can ingest and PluginMediaPlayer can play

- jcapture generates a nice playable Flash file. But this can't be edited on played on mobile devices. So we would need an option to export to a format Kaltura can handle (like webm. etc.)
- See: PluginMediaPlayer
- http://bgrins.github.io/videoconverter.js/

See also tickets here:

http://sourceforge.net/p/jcapture-applet/tickets/

Questions

- Any reason not to use the icon that comes with jcapture?
  - It's ugly?
    - haha, OK
- Any point for oEmbed?
