

# CKEditor4 for Tiki 12

Some notes about the plans and progress on WYSIWYG for Tiki 12 LTS

## Planning

- Refactoring and cleaning
  - Convert all WYSIWYG related AJAX code into Services
    - AutoSave (save, get, delete)
    - HtmlProcessing (conversion functions, towiki, tohtml, )
    - Preview
    - Inline (save)
- elFinder Integration
  - Use elFinder in a dialog to replace the current "popup window" *filegal manager*
  - Enable other Tiki functions in elFinder
    - Description (read & write)
    - Versions
    - Show fileid somewhere
    - Compress (and make extract better so it extracts into a new gallery)
- Plugins
  - Make all plugins apart from img (only probably) non-wysiwyg. I.e. only images will look like their final on-page representation, all others will be shown as "fake elements" similar to how ckeditor shows page breaks etc.
