We have been using group homepage redirection at login time for months on 1.10cvs with no problems. But in the latest couple of months, I would say, some bug might have been introduced since it stopped working recently ago, just after a cvs update.

We've noticed that if we uncheck: "Go to group homepage only if login from default homepage:" (at Admin -> General), then redirection works again (but we loose the right direction when somebody gopes to the tiki site after clicking to a forum post url from their email program on local.

Demonstrate Bug
A bit more info: if this is the same feature I am seeing, it seems to come from some errant information in \$_SESSION, which is loaded from lib/userslib.php around line 1312. var_dump shows this:

\$_SESSION['u_info']['group']['groupName'] is "&stringx = 'groupname..."

From that point on it fails: the code in get_user_default_homepage breaks down and just gets the first letter of the groupname, which it then tries to find a group homepage for (and fails, since it only has one letter...) and the process goes downhill from there.

I ended up commenting out the \$_SESSION stuff at 1312'ish in lib/userslib.php and it seems to work, but I don't know what else I broke in the process, so that isn't the Real Fix but may help someone else fix the real bug.

sylvieg seems to have fixed this for me.. does current CVS work for you?

dthacker 24 Apr 08 19:05 GMT-0000
Tested ok on SVN current as of 2008-04-24. dthacker
