Description
The plugin SQL can not retrieve data returned from a SELECT which is in a stored procedure. Stored procedures can be more secure than granting database read access to the TikiWiki server.

With MySQL, data can be retrieved from a stored procedure if the "mysqli" interface is used instead of "mysql", and if the client_multi_results flag is set before calling NConnect().

if( $dbdriver == 'mysqli' ){
$dbsqlplugin->clientFlags = 131074; // set client_multi_results
}

Importance
9 high
