Description

The Problem

i.e. the structure tree is partially accessible for anonymous -
but in the Page view /tiki-index.php?page=xyz all the substructures are clickable but they are not accessible (permission of the subtree gives a 302 for the visitor - so he must go back ...

a robot like google creates so much traffic because he wants to follow these dead links

so I thought this is solvable by a sitemap
but Tiki has no internal tool for a sitemap like some other CMS.
so I started with an online sitemap generator - but disasterarea 302 permission
next sitemap-gen.py from sourceforge but the same disasterarea 302 permission
but much bigger because it generates from the apache accesslog.

So next I thought about this mess! OK Why create a link if it is not clickable for anonymous
yes that's the first solution to give the thing a straight line

looks like a big bugfamily

<13> before a few days I started with working on a sitemap for tiki

<13> first Idea with using a external tool end up in a disaster
<13> this courced by permission on some struktures
<13> next disasterpart is the rewrite seo engine wich produces some pages 4 times
<13> each accessible in an other way
<13> the sitemaptool from sourcefrge which makes analyse of the access.log produces much more shit
<13> some things can be restricted in a config file but thats no god Idea
<13> so my suggestion to solve some of this sitemap disasters is to cancel all a href=... where annonymous can't click to
<13> this is more then recommented becouse all visitors and searchengines follow this links and get a 302
<13> with redirekt to login or whatever
