Description
Clicking on the module controls (up, down, across, remove) does nothing. Also (the easy to fix part), the module flipping icon overlaps the right-hand end of the module control icon.

Solution
The overlap can be fixed with CSS in layout.css. No idea about the module control function bug.

This is a regression from revision 9024, which changed usermoduleslib's interface. There are still calls using the previous interface, for example tiki-module_controls.php line 37 ($_REQUEST%22mc_move%22 is a module name). I told sylvieg about the problem, but this was hard to fit in her TODO list.
