Description

Made a new install of Tiki v3.2 on a Ubuntu 8.04.3 system as server (includes MySQL in version 5.0.51a-3ubuntu5.4).

Surfing at tiki-plugins.php produces the following error message:

```
<div class="cbox-data"><br> <div class="simplebox error"> <div class="simplebox"><b>An
error occured in a database query!</b></div><br> <table class="form"> <tbody><tr
class="heading"><td colspan="2">Context:</td></tr> <tr
class="formcolor"><td>File</td><td>tiki-plugins.php</td></tr> <tr
class="formcolor"><td>Url</td><td>tiki-plugins.php</td></tr> <tr class="heading"><td
colspan="2">Query:</td></tr> <tr class="formcolor"><td colspan="2"> <tt>SELECT
fingerprint, added_by, last_update, last_objectType, last_objectId FROM tiki_plugin_security
WHERE status = 'pending' ORDER BY last_update DESC</tt> </td></tr> <tr
class="heading"><td colspan="2">Values:</td></tr> <tr class="heading"><td
colspan="2">Message:</td></tr> <tr class="formcolor"><td colspan="2"></td></tr> <tr
class="heading"><td colspan="2">Built query was probably:</td></tr> <tr
class="formcolor"><td colspan="2">SELECT fingerprint, added_by, last_update,
last_objectType, last_objectId FROM tiki_plugin_security WHERE status = 'pending' ORDER BY
last_update DESC</td></tr> </tbody></table> </div> <br><br> </div>
```

edit: Sorry, forgot to mention that this bug also affects the using of plugins. Using a plugin in a wiki page that needs approval produces the same error message. (Saw someone in the irc log with this problem, which is also [this](#) bug, so I edit to clarify it.)

Solution

Had a further look with phpmyadmin and discovered that the *tiki_plugin_security* table is missing the *added_by* entry, which should be made by *installer/schema/20090913_plugin_security_addedby_tiki.sql*.

Don't know why the instruction from this schema file wasn't executed, but after manually doing it the plugin approval system works as it is supposed to.

I have the same issue with 3.3. Items requiring security approval such as use of Iframes or Module with user list gets an SQL security message. Attempting to access /tiki-plugins.php gets this message.

Can you explain exactly how you managed the SQL work around? Thanks
