the page tiki-admin_categories.php page don't display at all. The internet explorer page 'The page connot be displayed' is shown.

When I switch off the gzip compression of output in the general admin setting, the tiki-admin_categories.php displays an empty page (modules and menu are present but not the core page).

What is most interesting is that is broken on a production linux server running PHP Version 4.3.0 and works on wamp running PHP5 under windows... could someone help me?
