Description

We have a site_closed preference which is very useful.

However, this permits only the admins to access the site.

What if we want a read-only mirror?

It would be nice to have a preference for this, along with a message to users: "This site is in read-only" and admins could change this message to indicate where the live site is.

Perhaps it could be interesting to check if the mysql user is "read only" as well...

This could also be interesting if a project is completed and we want to keep a site in an archive but no longer have any changes.

Things like tiki-logs, date of last login, etc. will need to be considered.

Perhaps there could be a check: If current users have an edit/add permission (we'd have to make a list), then, they get a warning that the site is read-only (a message that the admin could change) and that any changes will be lost.

Workaround

Workaround is to put a [Custom Code HowTo - Post-It Notes](#) to warn users their data changes will be lost.

An idea from a discussion with Ricardo:

We could determine two types of tables: the ones we lock (ex.: wiki page content) and the ones we we don't (last login data)
