Description

Just recently (the last few days) I did post some answers in the forum and did need the CODE plugin to show some code.

The plugin seems to be broken, as most of the HTML code between the CODE text

□□□□□□□□

{CODE()}HTML will disappear after saving{CODE}
is stripped out of the wikipage source - just disappeared including the plugins end tag.

It is not a matter of misstyping, cause I did try several times.

I did not find time to reproduce yet, but it occurs at tiki.org/forums.

Torsten.

Workaround

Write a page on doc.t.o and link to it from the forums.

Fix in version 12
