Description

This was working in Tiki9, as far as I know.

12.x: profile data defined for item link field do not get stored in local tiki where profile was applied

Example: apply profile "Time_Sheet" (https://profiles.tiki.org/Time_Sheet), and notice that items "Watch TV" or "Setup of Tiki TimeSheet" had defined "General" in the field "Associated project", which is an item link field.

The field seems to have been well defined, since it allows the admin (once the profile has been applied) to edit a tracker "Time Sheet" item, and select the project from the drop down list (so far it only contains "General").

To be reproduced in short in a show.t.o instance associated with this item.

Solution

Item link field points to other fields by ID and not by value, which was a design change I think in Tiki 10. As a result, you need to update the profile to instead of pointing to "General", to point to

\$profileobject:project_general\$

Xavi, can you retest with amended profile? Thanks,

Confirmed: Fixed, thanks Nelson!
