Description
    The current ElasticSearch Implementation is very nice but I noticed that it is impossible to specify wildcard search (term*).
    This may not be a big deal for englisch users but in languages like german, we combine our words to form new ones. Example: Hoch (high) + Haus (house) = Hochhaus (Skyscraper).
    You can imagine that a lot of searches fail because people expect to be able to search for substrings.

    Alternatively allow us to manipulate the tokenization of the words by syllables or a dictionary.
