cannot be validated.

In this example, we are using: `ForumOut@myTikiSite.com`, need to use your Tiki mail servers domain (if different).

Note: this email address must be able to submit to the mailing list. So the user must be subscribed to the mailing list if closed. Unfortunately, web-based forum posts coming from the Tiki registered user account (that is, the registered users) cannot be sent from this same email address.

"Add messages from this email to the forum" The mail server, user and password of a POP3 account that is **solely** for retrieving the Tiki forum. No one should ever login to this account except Tiki. This email account is used to send messages to the mailing list and receive messages individually (no digesting).

In this example we are using:
 POP3 server: `mail.myMailHost.com`
 User: `ForumIn@myMailHost.com` and
 Password: (the password for that email account).

Hi Marc Laporte,

The problem is using mail ids with the tag, the parser consider the tag as part of the mail id that's why it showing like that. So to avoid that we can just simply add a space between the tag and mail id. (i.e instead of using like this example@example.com we can just use a sapce between underbars and mail id so that it looks like **example at example.com**) this will make the mail ids bolder. I informed Gary about it, he said he will update the docs according to above said.

Thanks.
