Description

I put Tiki 13.x but this problem started with Tiki 5 and continues through Trunk.

When you create a Tracker, there is an option for displaying the tracker item with template, and the template can be a wiki page or a template file. The documentation for that option has always been: "wiki:pageName for a wiki page or tpl:tplName for a template".

But if you use the template file option, and include the "tpl:" prefix with the template file name, then the template file is never found. The template file option works fine if you only enter the template file name and do not use the "tpl:" prefix.

I can not create a show instance because I can not create a template file on the show instance server.
