Description

I have noticed that the forum watch notification "eye" icons on the tiki-view_forum.php screen are both set if either of the two forum watch options are set.

Looking at function user_watches in lib/tikilib.php the code tests whether \$event is an array. If it is not an array then it does not filter the watches on event.

Adding

```
$conditions['event'] = $event;
```

to the else part of the array test corrects the problem.

This is confusing my users in 12.x

I think this should be an easy fix. The only concern is whether \$event is ever set to anything other than an array or a string.

Easy to solve?

I have a 15.2 installation and the problem is still here. I made `grep -r` on sources and found 23 calls to `user_watches()`. Event argument is a constant string in all calls. Even array capability is not used.

After adding `$conditions['event'] = $event;` to «else» branch in `user_watches()` the bug is gone. Subscriptions of `forum_post_topic` and `forum_post_topic_and_thread` now work independently as expected.

I'd like to see this forgotten line in the next Tiki. If noone plans to call `user_watches()` in a strange way, it won't break anything.

Hi Dmitry and oldelvet

Can you please join the developers list (see <https://tiki.org/Lists>) and discuss it there if needed? I don't have the skills to assess whether this is fine or not, but presumably yes, and you'd better request commit access (that's the easy part; see <https://dev.tiki.org/Commit>), and commit it yourself, after discussion in the developers list if any concern is raised by a wider audience.

Thanks, and welcome to Tiki!

Xavi

Also hi Dmitry!

Hoping to get time to review this soon, just can't now so wanted to say hi and welcome and not seem rude 😊

So "hi" and "welcome", and maybe join us on IRC sometime to discuss it further?

jonny
