Description
    After upgraded to 14.1, Wiki template page can not be applied as an input form in the
    PluginTracker. The error message shows "Missing template Name". But the same template while
    using in Plugin Trackerlist can display items and work fine. Does anyone have same problem? Or
   what setting I missed?

Hi,

Maybe i was too quick, but that show instance doesn't seem to show anything (i changed the admin password to 12345 by the way). Did i miss something?

Vincent Bénatier 25 Jun 21 20:08 GMT-0000

Hi,

I have the same kind of problem on tiki 22.2. The error disappears if you use the syntax "wiki:<template page name>" at the "Tracker Plugin Setting" level.

Vincent Bénatier 25 Jun 21 20:30 GMT-0000

Sorry, it was a rookie mistake. I mistaked the fields "Template File" and "Wiki" in the Tracker Plugin settings. Everything is ok now.
