Description

Hi,

So in the past I haven't had any problems with the Calendars working, but now it seems that the newest code from the trunk has cause the /calendars path to break. If I visit /calendar, or /tiki-calendar.php, the screen just thinks and thinks and after several minutes gives me a blank white screen.

Since this is the newest source code, I can't possibly be the only experiencing this same issue? I will do a demonstration below to see if this can be replicated.

Okay, so I discovered the issue with my calendars. It turns out that it is not a regression, and was in fact caused by an input to one of the calendar items from one of our users. Essentially, they were attempting to add an image to a calendar event, and instead of using the syntax that the 'Image' button uses, they did some sort of copy/paste using the wiki syntax.

Their input in the database looked like:

```
<p>{img fileId="791"}</p>
```

But the correct syntax looks like:

```
<p></p>
```

After hunting down the bug, it was determined to be the cause of our calendars getting hung during the loading screen, and resulted in the WSOD. After simply deleting these two entries from our database, the entire issue has been resolved.

Hopefully, there will be a way to restrict this from happening, as it took a couple of weeks to hunt this bug down, considering we had no idea when or where it originated from.

Since this issue has been resolved, this bug report can go ahead and be closed. Thanks!
