Description

Hi,

As of r57122, when I pulled in and merged the latest source code, I noticed a bug pop up in our calendars page. When I visit a calendar and click the button at the top right of the page that opens a context window to select all the other calendars. If the window appears on top of the calendar itself where there are any events, the z-index of the events is higher than the context window's and makes the context window unusable in some cases.

The solution I implemented was to raise the z-index of the #filtercal ID in the calendar.css file from 2 to 10.

Hope this helps!
