Description

Basically what happens is when you try to create a new calendar item, when altering the Start and End times, there is some sort of bug occurring in how it calculates the time codes in the back end. If the times of the event start in the AM and end in the PM, it causes some sort of issue with the way the timecodes are calculated. As well, it appears to be an issue with the 'predictive' functionality it uses. When you select something like an 8AM Start time, it will automatically try to adjust the End time to something an hour in advance or so. This will cause it to get hung up thinking, and sometimes it automatically changes the year to some distant future date like in the year 2507.

As well, selecting a Start time in the AM, and an End time in the PM such as 9AM-9PM causes the calendar to say "Events cannot end before they start."

To test: simply go to the Test calendar on the Show Instance and try creating a new event. Play with the Hours on the Start and End times by just changing them around several times. This will always result in the calendar lagging out and sometimes an unresponsive page.

I will replicate this in a tiki show instance.

Thanks.

Solution

Couldn't exactly reproduce as discussed in the comments but maybe r57822 might help?

Checking in to see if anyone has any information on this bug? Or should I expect to only see updates coming in after Tiki 15?

[Jonny Bradley](#) 17 Feb 16 16:04 GMT-0000

Hi, sorry not had time to look at this yet, and i think it's some code i wrote so have been meaning to...

Yes, the fix will appear (hopefully) in 15.x first but then should probably be backported to 14.x and maybe 12.x if it's there too. Just not sure when i can look at it realistically (hopefully in the next week or two so it makes it for 15.0!)

Sorry about that, keep checking and thanks for the report 😊

It's great to hear that the bug is being worked on. I appreciate your response, and look forward to any progress that can be made in the solution! I know the devs are busy with the Tiki 15 launch coming up, but please note that this is bug that has been introduced to our production environment, so we are hoping to find a fix as soon as possible. If there is anything that I can do to help with squashing this bug, please don't hesitate to let me know!

Looking forward to Tiki 15!

Hi!

Just checking in to see if there is any update on this bug. I noticed that it is still present in the Tiki 15 Alpha, as well as whatever code is being used for the demo.tiki.org instance of 15.x.

Let me know if I can be of assistance!

Jonny Bradley 07 Mar 16 20:38 GMT-0000

Hi

I just tried it out and it seems fine for me.

Just created 3 events here and edited them and messed about with the start and end time, and duration a lot, and it all seemed fine (although v slow in firefox sometimes).

I don't like the way the date picker appears each time i change the time, but apart from that seems to work for me.

I'm wondering if i'm seeing the same thing, i see 24 clock dropdowns, not AM/PM times - could that be the difference?

taylor dustin 14 Mar 16 18:12 GMT-0000

Hey Jonny,

I just went onto the 15.x demo.tiki.org instance and looked at the calendars again. It seems that the patch inside tiki-calendar_edit_item.tpl on r57824 fixed the issue. I believe it was a problem with the way the .change function was altering the end time when the user changed the start time.

Thanks so much for the work you've put into this bug! I will let you know if I run into any more issues.
