The problem is the pagebottom module zone rises up to cover the col1 content, which appears like it has a float not contained with a clearfix, somewhere in the col1 content. But I can't find the culprit so far. I did find that commenting out the `{if $edit or $recurrence.id gt 0} ... {/if}` section (lines 127-387) does let the page display normally, but I can't find yet what in those lines is causing the trouble.

If I add a `<div class="clearfix"></div>` kludge at the end of tiki-calendar-edit-item.tpl, the page seems to display normally. ;-)

By the way, this page is using the normal view, not the popup modal view.
