# Description

I want to use Tiki's banner system to manage hosted ads (such as Google Ads).

I created a new Tiki banner: tiki-edit banner.php

In the Select ONE method for the banner: field, I selected Use HTML and added the following script (from Google Ads):

<script type="text/javascript"><!-- google\_ad\_client = "ca-pub-3913918000422534"; /\* Info
Lettres 8 à 15 \*/ google\_ad\_slot = "8790064474"; google\_ad\_width = 728; google\_ad\_height =
90; //--> </script> <script type="text/javascript"
src="http://pagead2.googlesyndication.com/pagead/show ads.js"> </script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script>

Upon saving, Tiki adds <X> to my code, breaking the SCRIPT elements:

<script type="text/javascript"><!-- google\_ad\_client = "ca-pub-3913918000422534"; /\* Info
Lettres 8 à 15 \*/ google\_ad\_slot = "8790064474"; google\_ad\_width = 728; google\_ad\_height =
90; //--> </script> <script type="text/javascript"
src="http://pagead2.googlesyndication.com/pagead/show ads.js"> </script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script>

This happens even if I HTML Purifier disabled.

Tiki should allow full HTML (including SCRIPT elements) within the HTML box for Ads. I understand the security implication of allowing SCRIPT elements, but only users with permission to create ads can do this.

I tried creating a SHOW instance, but received the following error: Tiki Installer missing third party software files

#### Workaround

My workaround is to have Google Ads in a module and apply them to the pages by using the MODULE plugin. However, I can no longer:

- Track clicks (from within Tiki)
- Show/display the ad by time/date
