Description

When the same footnote is reproduced, this was detected in Tiki12 and both had the same number and would link to the same item in footnotearea

Now, as can be seen in our explanation page: <https://doc.tiki.org/PluginFootnote> duplicated footnotes are shown twice (the 3 & 4 both show *Ibid.*)

Using "sameas" option is not really a good solution because adding a footnote above other footnotes does not recalculate the sameas parameter even though the number of the previous footnote changed.

It seems the regression was introduced by: <http://sourceforge.net/p/tikiwiki/code/53263> but a simple rollback would remove the "class" option.

I suggest recovering the duplicate detection and also adding two new optional options:

Id (alnum)

sameasId (alnum)

so we can express that a footnote is the same as another by Id. This way, adding new footnotes only changes the numbers (displayed), not the Ids (not displayed).

Solution

<http://sourceforge.net/p/tikiwiki/code/59134>

Please test/comment before backport to Tiki15

In wikipedia, this is achieved using one option called "name". To include a reference to the footnote in another instance, an empty footnote call is made with the corresponding "name" defined. Its quite straightforward in its simplicity of use. <https://en.wikipedia.org/wiki/Help:Footnotes>.

Jean-Marc Libs 09 Jul 16 10:51 GMT-0000

Thanks for the link to <https://en.wikipedia.org/wiki/Help:Footnotes>. I did not know of it and they have really elaborate stuff there.

I had come to a similar idea, but I called them "tag" instead of "name". See here:

<http://sourceforge.net/p/tikiwiki/code/59134>.

Also, they use the same "name" option for tagging and refrerring to a tag. I think our system is easier to understand. Should I rename tags as names, using options "name" and "sameasname" instead if current "tag" and "sameastag"?

I also realise I used your classes for the wikipedia "group" option.

It's still in trunk because once it's in Tiki15, it's hard to change as people will have been using it.

Unless we want to change the semantic "tag"↔"name", I'll backport to Tiki15.
