Description

I'm trying to prevent a module from showing for a particular theme, but the standard method of using "!Tikipedia.css" for example, in the "Theme" input under the "Visibility" tab, isn't working. The module continues to display. I've tried upper and lowercase theme name and theme name without the file type extension.

Solution

Should be fixed in trunk in r59476 - will backport if it's ok
