Description

It is harder than it needs to be to use an image on a wiki (or other) page. you have to upload the image, then remember the id and use it on the page, or slightly better, upload an image then drag it to the screen.

The preferred behavior would be to select the image icon, which would then offer to upload or use one from the library. (so far, just like it is today) Then once you have uploaded an image, it should automatically use the image(s) uploaded and create the img tags on the page at the cursor. If I am uploading images, I should not then have to re-select the images to use.

There is at least one other recommendation to drag-drop images, which would be nice, though I suspect a bit harder to do, and would not invalidate this suggestion.

A suggestion (for that one) was to use the jcapture plugin, which is actually harder than the current approach as you have to use something else to display the image, then adjust your window(s) to display it, capture it, and still have to use it.

I agree it should be improved. Once you select and upload a picture it should be placed on the page without the "click on the image" extra step (not intuitive as there is not information about it).

By the way, once the image is selected I can't see the "upload" button that lead to confusion and this is not user friendly.

<https://postimg.org/image/vmhq2wkgz/>

(The "Screen Capture" option on the toolbar didn't work on Safari and FF = loading wheel then stop)

dstrohl 31 Dec 16 17:19 GMT-0000

Yup, it feels like it should not be that hard to have a button that does the upload and the generation of the wiki text in one shot... all the pieces are already there, it (seems like it) should be simply a matter of removing pieces.

drsassafras 01 Jan 17 02:48 GMT-0000

Agreed, I also think this should be default behaviour. No new options or buttons. If people don't want to use the image they uploaded, it's easy enough to delete it afterwards.
