Description

I just made a fresh installation on a shared hosting service (all-inkl.com) via svn and did not get the Tiki running after successfull installation.

The installation was made in a PHP7 document root.

Two problems:

1. Site never stopped loading
2. Dropdowns did not work (all dropdowns like login, quickadmin, etc) and added a # hashtag to the url in the address bar of the browser.

After a while (minutes) the site mentioned some JavaScript error in a popup error message.

I did change the PHP to PHP5.6 and then after a few minutes the site worked as fine as expected. There seems to be some coherence with the PHP version.

Is that maybe related with Xavi's Bug 6035 ?

Hi Torsten, can you try with php7 and disabling js minifcation? And just in case, clear tiki and browser caches (including cookies)?

And disabling gz compression if enabled in your site?

I've seen this error lately in *.t.o sites, and some of the previous cahnges fixed the issue (workaround, in fact) for me.

HTH

Xavi

P.S: We miss you at the TRM!

I was going to suggest those things too, and maybe also it might have been a javascript detect problem during installation that had coincidentally done away when tested later with php5.6?

My 16.x Tiki's all run fine on php 7 (now) but there are occasionally new obscure old libraries that we still use that need updating (i found some in the spreadsheets code the other week)

This sounds like the same issue we were having on tiki.org earlier. It works sometimes and other times does not. Its a complete mystery to me whats going on, but I don't think its PHP version specific. Clearing tiki cache and doing some things like that seemed to help before.... Along with what has already been said. Assuming that is that its the same issue, which it very well may not be.
