### Description

Hello team,

this may be the same for other types of code, but I have encountered this issue with XML because that's all I use.

Whenever you add bits of XML code between {CODE} tags in wiki-syntax mode, when you save, the code is displayed correctly. However, if at any point (before saving or when editing) you switch to WYSIWYG mode, and then save again, the code is not displayed.

If you switch back to wiki-syntax mode, the code has completely disappeared and is lost.

This is an issue in the sense that I only use wiki-syntax as the main contributor to our wiki, but the users may need to complement or amend some pages for whatever reason, and they need to use the WYSIWYG editor, otherwise they get swamped in the wiki-syntax.

The problem occurs at the moment when switching from WYSIWYG to WIKI:

1. You can write xml either in WYSIWYG or in WIKI and then switch to WYSIWYG later, then the code plugin shows the XML in the PluginCode.
2. But any XML code in the PluginCode get's wiped, when switching from WYSIWYG editor to WIKI editor and save.
