Description

tiki-admin.php?page=textarea#contentadmin_textarea-2 had its main section (Plugins) changed in r61597. It mostly works now, but there is still a problem when searching for short terms, i.e. those under `ft_min_word_len` (for MyISAM; the limit for InnoDB tables is controlled by a different variable).

If the query contains nothing but terms under the limit, all plugins are displayed. If the query contains at least one sufficiently long term, the too short terms are ignored.

One solution would be to display a warning about short terms next to "Plugins found containing: foo".

I am however wondering if we couldn't just go back to the previous code, which didn't have this problem (adapted to not show all plugins by default?). I guess one important reason for the change was to speed up page load, but page generation takes about 7 seconds here, which appears to be the same as, for example, Admin Profiles, so the gain is not obvious.

Trying to revert the change causes important conflicts.

Related: issue 6307

Solution

Made it optional in r62527 and it defaults to off and experimental (still can't find some plugins even

with elasticsearch - most odd...)

After updating to r62527, the problem remains by default. There is something buggy with that preference at least on my local 17.x. It offers to reset the value to unchecked, even though it's already unchecked. Perhaps flag values should be true and false?

I am setting status back to open, but not actually saying that this bug is caused by the recent changes.

Jonny Bradley 10 May 17 23:46 GMT-0000

You need to clear your prefs cache when running development version of tiki via svn - there should be a doc about this somewhere, no? I recommend running `sh doc/devtools/svnup.sh` if you are unsure about this.

Let me know if it's something else...

Philippe Cloutier 11 May 17 13:15 GMT-0000

Ah, sorry. It's probably documented but I admit I still find this behavior strange. Anyway, thanks. In a way, the bug remains conditionally, but feel free to close.
