• ● "Clike" code color scheme from CodeMirror not applied in Tiki

Description
Syntax highlighting for PHP (and presumably other languages) does not appear to work at first glance. Upon further inspection, its clear that syntax hiliting within the CODE plugin expects a HTML file, rather than an inline code example. I propose a reversal of behavior to expecting an inline example.

Using this code:

```{CODE(colors="php")}
// this is a comment
basename($alpha);
{CODE}```

This is output:

```// this is a comment
basename($alpha);```
On the other hand using this code:

Using this code:

```php
<?php
// this is a comment
basename($alpha);
{CODE}
```

The highlighting is now enabled, but its not really the right code example any more:

Using this code:

```php
// this is a comment
basename($alpha);
```
