Description
When including a maketoc into a page, the titles in the page are still parsed for WikiWords and Hotwords. This breaks HTML, links, and may decrease the readability of page TOC-s.

Solution
Hotwords and WikiWords should not be (distinct) links when they appear in a line of maketoc, the parser should just treat them as regular text.

To do so, the value of $line in parse_data_process_maketoc() could be copied before it is parsed calling
parse_data_inline_syntax(). That unparsed copy could then be used instead of what $line has become when building $title_text_base to append to $anch, about 200 lines below. It would still need to be parsed to a lesser degree though. It seems calling parse_data_inline_syntax() with true as third argument would do the trick (even though that’s claiming to be CKeditor).

If I put "TikiWiki" in the description of a wiki page and try to include that Wiki page in a structure with a table of contents, the then TOC places a hyper-linked question, part of the descriptive text that appears after the WikiedWord and then the actual page name.

This is visibly related to issue Tables of Contents (maketoc) can be broken when headings call plugins (such as ANAME and FOOTNOTE).

Philippe Cloutier 13 Sep 18 17:22 GMT-0000
The Parser_TOC_HTML_fix patch attached to ticket Tables of Contents (maketoc) can be broken when headings call plugins (such as ANAME and FOOTNOTE) should work
around this issue.
