Description
https://doc.tiki.org/WordPress-importer

Nothing happens when I load the file. I don't know if it just hangs or never starts at all. I do see the percentage countdown in my web browser, it does get to 100% but then nothing happens and no posts are loading into blogs, articles or wikis. Possibly the problem is the WordPress xml file. The only time WordPress has been trouble free (importing) was when it was from WordPress to another WordPress site. Including the OPML (links) file.

Would it be easier to import from Joomla? I tried them for a couple of months and did import most of my WordPress site there. (Images did not make it).

There must be a few others moving from other CMS type software to Tiki. Please help.

ok, we'll try to update and get working soon, for Tiki 18.

Keep an eye on these files:
https://sourceforge.net/p/tikiwiki/code/HEAD/tree/trunk/lib/importer/

Can we use your XML file for testing? (Assuming nothing is confidential)
