Description

When I create a wiki page to edit trackers using PluginTracker associated with a template and the fields option contains at least one field number, any other fields I put in the template is empty and can not be filled. On item creation, it works.

This is a big issue when the fields are meant to be displayed and not filled (itemlist fields, etc)

This seems to be a general issue: I also can't show the values which I should be able to put in the template according to this page: https://doc.tiki.org/Pretty-Tracker#Syntax_tips

```
{ $f_created }: created date { $f_status_input }: status input field { $f_status }: status (output)
{ $f_itemId }: the item id { $f_lastmodif }: last modified date (this will display unix date, for human
readable date look below) { $itemoff }: the iteration number of each item { $tr_offset }: the offset
of the item, i.e. this is the nth item of the total number of x items
```

Same issue with sending emails

```
{TRACKER(trackerId="5" fields="72" action="Submit" overwrite="y" itemId="{ $itemId } }"
showdesc="n" url="/Concours" tpl="projet-soumission-Initiative_stratégique.tpl"
email="noreply@xxx.ca|createdBy|projet-soumis-membre.tpl" emailformat="text" )}{TRACKER}
```

Will not recognize and include `{ $f_49 }` or `{ $mail_item_desc }` (this should show the title field, which happens to be 49 also) in `templates/mail/projet-soumis-membre.tpl`

But :

```
{TRACKER(trackerId="5" fields="72:49" action="Submit" overwrite="y" itemId="{ {itemId} }"
showdesc="n" url="/Concours" tpl="projet-soumission-Initiative_stratégique.tpl"
email="noreply@xxx.ca|createdBy|projet-soumis-membre.tpl" emailformat="text" )}{TRACKER}
```

Will replace `{ $f_49 }` with its value but still not `{ $mail_item_desc }`

This is an issue because the fields to display in the mail are not always the same as are present in the tracker edition form. For instance, I want people to only update the field 72 (a checkbox) and get a confirmation email but all the rest was already filled on other forms.

Hi Jean-Marc,

Can you say which version of Tiki this worked in? That might help identify the regression.

I don't really understand why if you specify field 70 you expect other fields to be available in your custom template, why not leave the fields param empty and just use what you want in the tpl or wiki template?
