### Description

In corner cases, a footnote number in the footnote area will display alone on its line. The beginning of the note itself will go to the next line. There are 2 conditions needed for a footnote to be affected:

1. it contains an HTML paragraph (<p>)
2. it has a line long enough to wrap, as in the following:

Example

Content{FOOTNOTE()} Paragraph with at least one really long line which continues, continues, continues, continues, continues, continues, continues, continues, continues, continues, continues, continues, continues, continues, continues, continues... \*Dummy item in a list which makes the preceding paragraph a real paragraph {FOOTNOTE} {footnotearea}

This was caused by a switch to `parse_data_plugin()` in r61394. That being said, the previous situation was already not ideal. The footnote number is inside the horizontal space occupied by the footnote itself (data), so there is no real distinction between the footnote number and some number which would be at the beginning of a footnote. I believe each footnote should be displayed using 2 rectangles with equal height. The content of a footnote should be in a rectangle to the right of a small rectangle containing only the footnote's number. This would match Wikipedia's behavior. `wikiplugin_footnotearea.tpl` could be modified accordingly, but adopting the HTML used by Wikipedia would require us to change behavior a bit.

<https://stackoverflow.com/questions/15817019/how-to-float-an-element-left-with-full-height-of-the-wrapper/15817129> has suggestions for how to achieve Wikipedia's design (without having to resort to a caret to link like Wikipedia, which prevents us from using an ordered list). I find "The display: table solution" and "The flexible solution" promising, but the latter might be a problem for Internet Explorer (see <https://caniuse.com/#feat=flexbox>).
