- ⊗ Increase L&F options for navbars

Description
    When a fixed-top navbar is used, the page needs top padding of the same height as the navbar to prevent the navbar from obscuring the page content. Also, when an in-page TOC is used, and a link is clicked to go down the page to the relevant heading, the heading will be positioned at the browser window top, and under the navbar, unless there is an offset (such as margin/padding on the target heading).

    Currently there is default pagetop padding for layouts using fixed-top navbars, but there isn't a fix yet in the Tiki stylesheets for the TOC problem (the Tiki project sites have a custom CSS rule as a fix). However, the height of the padding may not be right for all sites because the navbar height can vary depending on navbar content, font size, and so on.

    Being able to specify the navbar height would ensure having the right px value for the site. (If there is a JavaScript solution instead that could be automatic and solve the problem, that would also be an acceptable solution, as far as I know.)
