Description
    Hello all!

    I have a Tiki instance, installed with regular Apache and `.htaccess` and I tried to put the Ngnix as a reverse proxy for that.

    The Nginx was setup to accept just https connections. The scheme is forwarded by using the header `X-Forwarded-Proto`, which is suggested by nginx documentation. While Tiki does not recognize that, Tiki pages will use the regular `http` when rendering action on any form, like auth form for example. When user POST to http://, the proxy will redirect http to https and the POST request will be lost.

    I suggest Tiki recognize `X-Forwarded-*` and also `Forwarded`, as we can find on https://www.nginx.com/resources/wiki/start/topics/examples/forwarded/.

    Cheers,
