Description
    When doing a fresh install of branches/19.x via tiki-install.php UI: if the user selects MyISAM as the
    database engine of his choice instead of the default InnoDB, then after the last step where user
    chooses to lock the installer there is a system error instead of the screen to change the admin login
    on the `tiki-change_password.php?user=admin&oldpass=admin&newuser=y` (which is really a
    shame):

    An error occurred while performing the request. Things to check: Did you complete the Tiki
    Installer? Is your database corrupt? Please see how to repair your database Are your database
    settings accurate? (username, schema name, etc in db/local.php) Please see the documentation
    for more information.

    See https://screenshots.firefox.com/AZAjqNbyHSzadvdJ/demo.luciash.eu

    With InnoDB the same process works nicely and the user is welcomed with the admin login
    password change.

Did anybody test this? How come the unit tests did not catch it?

Solution

There were a number of commits regarding utf8mb4 migration and also secdb generation/handling. As of version r68000 of branches/19.x all seem to be working.

Tested as if version r68000 (after some fix) and successfully complete the process using MyISAM and InnoDB.
To test branch 19.x as if it was the release I've also tested by copy tiki-secdb_19.0alpha_mysql.sql to tiki-secdb_19.0svn_mysql.sql

@luciash d' being , can you have a look again?

luciash d' being 16 Oct 18 11:33 GMT-0000

Yes, fixed, thank you!
