Description

Most PHP errors are handled by initlib.php's tiki_error_handling(). This function was added by mose in r7041 (and completed in r7086) to implement the "Show PHP error messages" button at the bottom of pages and have errors grouped rather than all over the place. Unfortunately, when a callback set with set_error_handler() does not return false, it also bypasses the default error handler, which may log errors. This means that no matter how PHP is configured, nor how Tiki is configured, errors triggered after lib/setup/error_reporting.php ran are not logged.

Solution

The attached patch should fix. There is another huge bug which would persist though - error_reporting.php can set that error handler even in a request which does not show footer.tpl, meaning that errors in such requests are never displayed. Currently, this means that these errors are completely lost (with this fix, they will at least be logged).
