Description
Steps to reproduce:

- Assign a "category" field type to a tracker.
- Populate some fake data for testing.
- Create an itemlink tracker type and point it to the tracker that has the category type.
- In the "multiple fields" section of the itemlink, specify the category field created earlier.

Now fill out the tracker data. You will see that where the category is listed in the edit page, there is an "Array" where it should say the category name.

Now select the item and save.

You will see that the category correctly shows outside of the edit interface.

I can create a show instance if this is not clear enough. I'm attaching some screenshots as well. They should be relatively self-explanatory as well.
