- ✕ Package, mPDF, Print; Installing the mPDF package on Tiki24 update composer and it now require PHP8 (brick the Tiki)

Description

When a package is enabled where the system requirements can not be met, it causes composer to fail to install all packages.

saml is one of our packages that is causing this blockage right now.

Perhaps it would be best to have composer check the system requirements have been met for a package before allowing it to be enabled since enabling it without the requirements will cause composer to fail badly.

To reproduce: enable saml, then try to install other packages.
