Description
It would be fantastic to get even more structure and relations between wiki-items. The most innovative way at this point is to work with ontologies. Therefore it would be helpful to base a tikiwiki on an ontology.

Solution
Tikwiki has to work with a program like Sesame (http://www.openrdf.org) and/or Jena (http://jena.sourceforge.net/) to function properly with a created ontology.

In a more practic view, the data that people insert/edit shouldn't be stored in a straightforward manner (e.g. plain text in a MySQL database) but rather in RDF in the Jena/Sesame repository or database.

Workaround

ML: check out Semantic wiki links in 3.0!
