Description

There is a string in /lib/prefs/username.php that really gives me headaches. How on earth does this have to be escaped, so tra() will catch it from the array_merge in custom.php?

Here is the entire file:

```
<?php // (c) Copyright 2002-2016 by authors of the Tiki Wiki CMS Groupware Project // // All
Rights Reserved. See copyright.txt for details and a complete list of authors. // Licensed under
the GNU LESSER GENERAL PUBLIC LICENSE. See license.txt for details. // $Id: username.php
66909 2018-07-07 14:48:30Z chibaguy $ function prefs_username_list() { return [
'username_pattern' => [ 'name' => tra('Username pattern'), 'description' => tr('This regex
pattern requires or forbids the use of certain characters for username. For example to add
Hebrew use: /^[ \\\_a-zA-Z0-9@\\.\n-]*$/ or for Chinese use: /^[ \\\_a-zA-Z0-9@\\.\x00-\xff]*$/'),
'type' => 'text', 'size' => 25, 'perspective' => false, 'default' => '/^[ \\\_a-zA-Z0-9@\\.]*/', ], ]; }
```

I hope you had at least some fun constructing this string... Now I have to rewrite this in double quotes, because that is the syntax in custom.php...

Thanks

hman

Another warped string is this from `/lib/prefs/saml.php`:

```
<b><a class="linkmodule" href="tiki-login.php?auth=saml">{tr} {if  
$prefs.saml_option_login_link_text eq ""} Log in through SAML2 IdP {else}  
{ $prefs.saml_option_login_link_text } {/if} {/tr}</a></b>
```
