Description
   Active Directory doesn't allow for anonymous searches of its structure. Instead, an username and password for an account with search access must be given when connecting.

Solution
   This patch adds the required functionality. It appears that support already existed but has been broken in the most recent versions, because the scripts that populate the tiki_preferences table (such as db/tiki-1.9-mysql.sql) already contain the necessary preferences (auth_ldap_adminuser and auth_ldap_adminpass).

   The latest version of Pear:Auth was integrated into v1.10 and support for non-anonymous binds was included.
   The admin will need to set *admin user* and *admin password* for this to work.

Comments

Greg Martin 06 Jan 07 04:43 GMT-0000

In 1.10, we update PEAR:Auth:LDAP and implemented the Auth:LDAP features binddn an bindpw options using the tiki preferences you described (adminuser & adminpasswd. This should be working there.

It could use some testing

\\Greg
