Installer quiets errors in all database queries | Tiki Wiki CMS Groupware :: Development

Installer quiets errors in all database queries

### Status

● Open

### Subject

Installer quiets errors in all database queries

### Version

6.x

### Feature

Installer (profiles, upgrades and server-related issues)

### Submitted by

Philippe Cloutier

### Lastmod by

Philippe Cloutier

### Rating

★★★★★ (0) ?

### Description

Since r20087, database errors during the installer have an empty error handler, because failures in queries from upgrade scripts are already properly reported.

This unfortunately also has the bad effect of quieting all other errors in queries outside upgrade scripts.

I just spent several hours searching for the reason as to why i always only get a blank page after pressing the 'Install' button.

Only after doing a manual install and then going to the page of the installed tiki I get errors about DELETE permission not there. -> Checked DB permissions and it turns out yes that's it! My user didn't have the permissions to create or alter anything in the DB... simple mistake, but waaay too long troubleshooting.

The script should not ignore errors silently imho.

the least it could do is write a line saying something is wrong with your DB setup or something so one knows where to start to look.

Preferrably even check the permissions for the user *\*before\** running the update script and telling the user he failed at setting correct DB permissions. (In general quickly testing if DB works and permissions are OK before trying to run the script would be good, especially since 2 queries require FULL permissions in the DB not just CREATE, ALTER,.. — I think some index and collate stuff)
