Description

If you uncheck the option:
Content is parsed like wiki page

some features of the tiki wiki will not work anymore.

Our case:

We have many code examples where we, for example, have arrays like you have them in javascript with square brackets. ["array"]

When wiki syntax is parsed, the square brackets are interpreted as a wiki link, which is not the case.

The solution:

we solved the problem with the option "Content is parsed like wiki page". We unchecked it, so wiki syntax is not interpreted.

Side effect:

Now, if we try to insert an image from the file gallery, tiki wiki inserts it as a wiki image with the wiki syntax. That won't work, obviously.

Another feature that won't work anymore is the codemirror plugin. The plugin inserts wiki syntax too.

My opinion:

All features that use wiki syntax have to check, if this option is set. If it is not checked, than they have to insert html. I mean, if the file gallery inserts a simple img html tag, it would simply work, the same for codemirror.

Solution

Seems to work for me using one of the following:

1. No parse tags
[array]

1. PluginCode

[array]

What about one of the following:

1. Using PluginCode

[array]

2. Using the no parse tags
[array]

GriessbreiLP 04 Nov 15 13:34 GMT-0000

If you use two open square brackets and one closed, you get the same outcome. BUT, now comes the fun part, if you edit the page again, tiki wiki will parse the two brackets to one so that the view in the wysiwyg editor is correct. If you save now and display the page again you will see, that tiki wiki saved just one pair of brackets and now shows a link.

So with every save, edit, save, edit, the outcome CAN be something else, which is definitely a bug.

And the other case I wrote, if you deactivate "Content is parsed like wiki page", the filegallery and some other features don't work anymore but are still available, and this, in my opinion, is a bug too.

If tiki wiki doesn't support the combination "content is parsed like wiki page" - deactivated and file gallery then there MUST be a hint. Or the button of the filegallery must be hidden, or, what would be in my wish, the filegallery has to support html.

As you can see in the example tiki wiki i created, that is not the case.

Hi,

I don't seem to be able to login to the show instance you created so I'm not sure what features you're using where you see this and when it creates a problem.

In modules, for instance, there is a choice as to whether to wiki parse or not. If you click the button to add an image, it will add wiki markup regardless. Perhaps this an example of what you're referring to. All of the shortcut edit buttons add wiki markup since the idea is that people may not be familiar with wiki markup but would presumably know how to add HTML. But I can see where it would be handy for the image shortcut in particular to add HTML when not wiki parsing.

But back to the problem I originally tried to answer, if you are able to get [array] to not show up as a link using the no parse tags, could you then turn back on the wiki parsing and avoid the issues you are having? I'm not familiar with the double bracket trick, but the no parse tags should be a safer way to go.

Regards,
lindon

wysiwyg_wiki_parsed was changed a lot between r65026 and r65085: <https://tiki.org/forumthread67421>

I would expect this problem will not apply to Tiki 19+.
