Best practices for a local Git repository and interacting with the Tiki community

This is a draft

Related: Git and SVN combined workflow

Use case

- You manage several Tiki instances
  - Divergent Preferences in Staging Development Production
- You have local modifications to maintain
  - Ex.: a theme
- You want to upstream what is relevant
- You may be running various versions of Tiki. Ex.:
  - Older LTS versions for stable projects
  - Some more recent versions in production
  - Some projects in development
- You may run multiple servers (like virtual machines)
- You need a tool like TRIM
- You may have additional testing processes and policies

This page will document an appropriate process / workflow.
