PluginSubTitles

This is an idea for SRT files which would help with Kaltura integration.

Todo: double-check if we should use .srt or another format

- Edit mode: SRT format
  - Easy copy-paste to other apps
- View mode: a nice table with start time and text
  - Clicking on a line should instruct video player on current page (if any) to 2 seconds before that time
- A new view mode (ex.: &mode=srt) similar to tiki-index_raw.php which strips everything and only shows the srt format
  - This will permit this URL to be fetched directly by the video player, but needs to be on the same domain though
