Tiki14Upgrade
Notes about issues and solutions detected while testing the upgrade of tiki.org sites to Tiki14

logos squashed or too small [fixed]

1.2. RTL language is broken
Temporary solution for monolingual Tiki is to modify your themes/css/yourtheme.css by adding “direction:rtl” to:

- .container
- @media (min-width: 768px) {
  .modal-dialog

more to come...

- 😄 Should this (or something) be committed to SVN now and fixed before the release? Is there a bug report? I found at least one developer who made an "RTL for Bootstrap" CSS package - looks like a single CSS file. https://github.com/morteza/bootstrap-rtl (MIT license)
  - +1 to add [morteza/bootstrap-rtl](https://github.com/morteza/bootstrap-rtl) (tested and it works nicely - needs to be put in a condition if $prefs.feature_bidi eq "y") to branches/14.x and remove the obsolete BiDi.css - it more breaks than fixes things
  - added to [http://composer.tiki.org](http://composer.tiki.org) in 55259 (waiting for propagation - then I will add it to composer.json in branches/14.x)

1.3. themes.t.o upgrade
See [https://themes.tiki.org/Tiki14_upgrade_configuration](https://themes.tiki.org/Tiki14_upgrade_configuration)

1.4. dev.t.o upgrade
1. font color red of site title & subtitle as in bg
2. buttons from search module in topbar take 2 lines even if empty space available
3. top bar with "All communit sites" menu + Login + Lang dropdown is fixed, and does not resize as in doc.t.o or themes.t.o
   some profile needed to be applied?
4. App menu #42 Settings item was corrupted somehow, made a clone of it for the record and reset to default

1.5. doc.t.o upgrade
1. font color green of site title & subtitle as in bg
   - I don’t know how to change site title. Site subtitle did change to white with the equivalent approach:

```html
header.header .sitetitle { color: white !important; /* text-shadow: 2px 1px 0px #143C64 !important; */
header.header .sitesubtitle { color: white !important; /* text-shadow: 2px 1px 0px
```
2. loooong doc.t.o menu in the side column of doc.t.o
   Code from the module says:
   
   ```
   {menu id=43 bootstrap=y decorations=n notitle=y}{menu bootstrap=y structureId="HomePage BootstrapTricks"}{menu bootstrap=y structureId="HomePage AdminGuide"}{menu bootstrap=y structureId="HomePage UserGuide"}{if $group neq ''}{menu bootstrap=y structureId="HomePage Author"}/if
   ```
   
   - I wonder why there is no title for each of these menus, or how did they survive in 13.x: it's currently unreadable with so many links one after the other
   
   I added the param "notitle=y" for all of them, but no change, apparently. Therefore, I manually added some name for each menu:
   
   ```
   {menu id=43 bootstrap=y decorations=n notitle=n}__BootstrapTricks__ {menu bootstrap=y structureId="HomePage BootstrapTricks" notitle=n}__AdminGuide__ {menu bootstrap=y structureId="HomePage AdminGuide" notitle=n}__UserGuide__ {menu bootstrap=y structureId="HomePage UserGuide" notitle=n}{if $group neq ''}__Author__ {menu bootstrap=y structureId="HomePage Author" notitle=n}if
   ```
   
3. funky ui after preview on a translate process. See:

4. Plain registered user "xavi" in doc.t.o sees a couple of menu entries under Kaltura:
   - Edit languages : tiki-edit_languages.php
   - Menus : tiki-admin_menus.php
   
   Maybe the heading "Settings" of higher level should be shown if a user has perms on those 2 items?
   
   user with admin perms ("xavidp") see's the menu properly.
