Update

Assuming you got Tiki via SVN, you can easily update using:

What version am I running?

svn info

Or you can check in tiki-admin.php?page=general

Files

If you got your check out before 2012-12-12

Update from SVN pre 2013

Check status (svn status)

To check for differences between your code base and the official one
svn status

Minor upgrade (svn up)

Upgrade all your files to the latest version on the current branch (Ex.: from 6.x to 6.y) or latest version of trunk.

Files, directly

svn up

Update to a specific revision

svn update -r 43705

This can be used to downgrade as well. But keep in mind that your database structure can't be automatically downgraded. Database structure typically doesn't change much between minor revisions.

Files, via script

svn up
Will output the current revision number. See Module SVNup to show version within Tiki.

This can be on a cron job.

**Major upgrade (svn switch)**

You can upgrade from 2.x to any later version, in one step. All data migration files are included in each version. For example, from 4.x->7.x, 2.x->6.x, etc.

This is when you switch from one branch to another. When you switch (especially from an old version), you will perhaps get an error message about some directories or files that were not previously in version control (ex.: templates_c). This could be "svn: Working copy 'temp/cache' is missing or not locked". If these are directories that you didn't customize (very likely), you can simply delete them and try again. Otherwise, rename them, and you can manually merge your changes back in later. This is caused because we reorganized the code.

Here is a typical error and how to resolve

```
svn: Failed to add directory 'lib/jquery/jquery-ui': an unversioned directory of the same name already exists
```

Delete problematic directory

```
rm -rf lib/jquery/jquery-ui
```

and run svn update again

```
svn update
```

**switch to branches/12.x**

Go to where the Tiki code is and run the following commands

```
svn switch https://svn.code.sf.net/p/tikiwiki/code/branches/12.x .
svn up
```

**switch to branches/15.x**

Go to where the Tiki code is and run the following commands

```
svn switch https://svn.code.sf.net/p/tikiwiki/code/branches/15.x .
svn up
```

**switch to branches/17.x**

Go to where the Tiki code is and run the following commands

```
svn switch https://svn.code.sf.net/p/tikiwiki/code/branches/17.x .
svn up
```
Note: When switching from a from 16x to 17x some error caused by changes in the way Tiki set or handle Composer may occurs. You may have to delete caches or some files from previous install.

IE:

```plaintext
Fatal error: Uncaught exception 'Symfony\Component\DependencyInjection\Exception\InvalidArgumentException' with message 'You cannot set service "service_container".'
```

Is solved by deleting: temp/cache/container.php

**switch to branches/18.x**

Please note: SVN updates (for all versions of Tiki) will stop in January 2023 when **Tiki18** reaches end of life, so you should get your updates from Git

Go to where the Tiki code is and run the following commands

```
svn switch https://svn.code.sf.net/p/tikiwiki/code/branches/18.x .
svn up
```

**switch to branches/21.x**

Please note: SVN updates (for all versions of Tiki) will stop in January 2023 when **Tiki18** reaches end of life, so you should get your updates from Git

Go to where the Tiki code is and run the following commands

```
svn up
```

**switch to trunk (the next major version)**

Please note: SVN updates (for all versions of Tiki) will stop in January 2023 when **Tiki18** reaches end of life, so you should get your updates from Git

Go to where the Tiki code is and run the following commands

```
svn switch https://svn.code.sf.net/p/tikiwiki/code/trunk .
svn up
```

**switch to a specific version**

Go to where the Tiki code is and run the following commands

```
```
Update file and permissions & database

```
sh setup.sh
```

This can be on a cron job, if you indicate the user & group params.

Setup.sh will prompt you to run Composer, which updates your database. You can go to tiki-install.php, you'll have the option to click on "automatic database upgrade"

This is easy thanks to Database Schema Upgrade

There is no database downgrade so make a backup before you proceed.

.htaccess

Upon install, _htaccess must be renamed .htaccess

Because of this, svn up doesn't keep it up to date.

To see if there was a change, you can do:

```
diff _htaccess .htaccess
```

If there is a difference, you can delete .htaccess and rename _htaccess to .htaccess

Clear cache

From web, visit tiki-admin_system.php?do=all

```
php console.php cache:clear
```

Update search index

- tiki-admin.php?page=search&rebuild=now

Combine all steps in one

```
php doc/devtools/svnup.php
```
