Federation

This page is to document and brainstorm on what to use and improve Tiki in a federated context. Ex.: several Tiki instances need to work together somehow. (vs Workspaces within one Tiki). This includes SisterWiki, InterTiki and the Communication Center.

Xavier's thoughts

- My wish:
  - Workspaces were mature enough for that (like course in Moodle, etc). (Power) End user creates a new space, and every thing works (like a jail) by default allowing full delegated perms inside but no extra perms outside.
  - However, I fear that Workspaces to be used in production by end users (not by experienced Tiki admins or power users) would need another effort of improvement, and probably, a Tiki Fest to gather and implement the ideas needed to be discussed and implemented in a common direction, etc.
- My implementation if I had little time and/or budget and I needed something like this?:
  - federation (separated Tikis) and switch / enable / improve current features for search, login, links, etc., as indicated below. And maybe reusing Multitiki if all the tikis require same version, and/or tweaks, design, maintenance, etc.

Existing features in Tiki

- Web Services
- Federated Timesheets
- Federated Search, including "Elasticsearch Tribe Node URL"
- Remote Tiki Autologin
- Content Authentication
  - Files Tracker Field
- External Wikis
- Tracker Synchronization
- Email - Mailing lists - Forum Synchronization
- LDAP Synchronization
- Webmail (IMAP/POP3) Synchronization
- InterTiki
- Communication Center Send and Receive Articles and wiki pages
- CDN

- Raw page display - shared wiki page content served as text/css file type resource so you can do things like federated Sister Sites Customizations with collaborative editing and version history - ideal for quick fixes and there is no more need for copy-pasting manually in Custom CSS textareas and making sure one is keeping the sites in sync...
- Wiki-plugins fetching remote content/wiki pages:
  - PluginHTMLFeed
  - PluginHTMLFeedLink
  - PluginSnarf

## Related use case

- Being able to share content between t.o websites, something like (list of all new stuff in Tiki17):

  ```
  {include page=tiki17 site=doc.tiki.org filter=h2,h3 truncate_char=70}
  ```

- Advanced configs of trackers that are on master are replicated on the slaves: Data lives on slaves, and configs are taken from master (need migration scripts of certain changes) for the

## Sharing categories

- Some categories can be shared between sites. Ex.: main site has category list and some sister sites
should mirror it.

Groups and permissions

- Group names should be shared between Tikis (like we do for *.tiki.org federation) to permit proper access control.
