

# Mail Merge

Some use cases

## Simple: Customized messages from Newsletters

Tiki newsletter allows composing the message to recipients taken from the emails shown from a smarty template which is fed from a tracker. The idea is to extend the system to allow the newsletter body to be composed based on the smarty template itself, allowing to add values from fields in specific parts of the message body.

In our work, we might be interested in helping to fund this development, if not too expensive, or if others are willing to collaborate to co-fund the development.

## 1.2. Medium: PDF generation of unique letters

- Merge data from trackers with a wiki page template and convert to PDF

## 1.3. Advanced: Return books borrowed from a Library

This should be doable with [PluginListExecute](#), new in [Tiki11](#)

We want to make a mail merge for the following scenario:

<http://wiki.duboue.net/index.php/LibreOfficeNLG>
