

## Permission inheritance

→ Jyhem: If certain groups of registered users should not have a permission, you should not give this permission to *Registered*.

1. In ~~tiki\_admingroups.php?group=Registered&cookietab=3~~, it's possible to remove someone from ~~Registered but not via tiki\_adminusers.php bug or feature?~~ Fixed for Tiki10
  - Jyhem: I believe removing someone from *Registered* wouldn't work. *Registered* is pretty much hard coded in a lot of places. As are *Anonymous* and *Admins*.
  - Since Registered group is automatic, interface should say; "New user created with username test1 in the group Registered"
2. Does Registered always get the rights of anonymous?
  - Jyhem: No. This is a design decision. It allows useful things to be done simply by unexperienced admins, like show a login module only for *Anonymous*.

## Global vs categ/object permissions for not-yet created objects

1. tiki\_p\_edit is required globally to be able to create a page, even if use is allowed in a cat
  - System should check if I am allowed anywhere and restrict creation to there
    - We can use "Default category assigned to uncategorized objects edited by a user with this default group"
    - If tiki\_p\_edit for at least one categ, offer that list
